

Method and Apparatus for Air and Bus Charter Management Via Wide Area Network in the Gaming Industry

Abstract

This invention relates to the art of reservations management, and, more specifically, to a distributed system for a casino establishment to plan and arrange for passengers on air and coach charters traveling to and from a casino establishment via a wide area network. This invention allows for the remote management of names and personal information in a distributed environment and/or player self-service wherein a player may introduce their own name and credentials to the system, have the system apply rules to the approval of the trip, and ultimately track all seat and manifest information.
